materialised

Silica can be cleaned very simply with just a damp cloth. We recommended the following cleaning procedures for various types of spills:

Step 1: Clean affected areas with a damp cloth.

Step 2: Virtually all stains can be removed using only the procedure explained in Step 1; however, if desired, Step 1 can be followed by additional cleaning using soap and water, 4 parts water / 1 part bleach solution, or any solvent-based cleaning agent without causing harm to the surface of Silica or its performance attributes. Thoroughly rinse with water.
